

How to understand MAGNETEC's Datasheet

The objective of this document is to help to understand MAGNETEC's **core** and **component** datasheets on the examples MB-667-01_01 and M-116-03_05 as being EMC core and choke and on the example M-757 and MB-375 as being CT core and component.

Here are example datasheets: the upper left side is for the EMC core and the upper right side is for the EMC choke and the lower left side is for the CT core and the upper right side the CT component. Note: The datasheets may not be the latest ones.

EMC core

MAGNETEC's core datasheet consists always of five sections plus a header and a folder section.

Header section:

Client:	MAGNETEC GmbH	Magnetec P/N:	M-116	Magnetec A/N:	12158
Client's P/N:	/	PS Index:	03	PS Revision:	05
Subject:	EMC Wandler				
				Type:	E

Client, being MAGNETEC for a MAGNETEC part and customer's name for a customer's part.

Magnetec P/N: product name; M-xxxx for cores
MB-xxxx for components.

Where x stands for a digit: 0,1,...,9.

MAGNETEC A/N: ERP Number. Due to internal traceability reasons.

Client's P/N: client's part number if available and requested for customer's part.

PS Index: identifier, which is increased in case of major change.

PS Revision: identifier, which is increased in case of a new revision of the datasheet, either major or minor changes.

Subject: showing whether the product is an EMC core or component or a CT core or component

Mechanical Outline:

Nominal core dimensions are the informative mechanical dimensions (outer diameter x inner diameter x height) of the round magnetic core (in case of a not round shape core, it is the equivalent round core size)

Finished product dimensions are the final mechanical dimensions archived after fixation of the annealed core, e.g. with a case, with an epoxy coating, epoxy coating and foil bandaging. Note: adhesive tape and foil bandage are excluded here; they are result in slight bigger dimensions, see info on the corresponding datasheets. The finished core dimensions are measured with calliper on 3 different points and worst one of the three measurement is used.

Core data:

2. Core data (nominal values)			
Core material:	NANOPERM®	$L_{Fe} = 45,39 \text{ cm}$	$A_{Fe} = 3,24 \text{ cm}^2$
Permeability level	~30 000	@ frequency 10 kHz	@ H peak 3,12 mA/cm

Nominal values (informative parameters only)

Core material and its magnetic path length **L_{Fe}** and magnetic cross section **A_{Fe}** are given just for information only.

Permeability level is given as estimated value without tolerance at the given frequency and excitation level **H_{peak}**. Guaranteed Inductance (AL) values given in section 3 Inspection values.

Inspection values:

3. Inspection values				
	Measured value	Measurement limits	Frequency	I _{eff} x N [mA x turn]
	AL [μH]	20,9 - 45,0	10 kHz	100
	AL [μH]	10,5 - NA	100 kHz	100

The guaranteed parameters are listed. **AL** is the inductance of a core at one turn. **I_{eff}*N** is the excitation level (called also work-point) at which the AL value is measured; please don't mix it with saturation. For saturation current estimation, we have the abacus tool online <http://www.magnetec.de/dimensioning/abacus/abacus.php>

The first line means, that the core have a guaranteed AL value window between 20,9μH to 45μH at a frequency of 10kHz at a workpoint of 100mA turn.

Where temperature is not given, the test is valid for room temperature, T=23±3°C.

Core finishing:

4. Core finishing	
Type:	Cased
Marking:	MAGNETEC M-116-03 YM (YM = Year/Month), acc. to IEC 60062 6.1.1
Packaging:	1 pcs. per layer; 5 layers per carton box ; PU = 5 pcs.

Type defines the type of fixation like cased, glued into cased, impregnated, cut, epoxy coated or foil bandaged cores. In case of epoxy coating, we cannot grant a minimum coating thickness, the coating is not uniform all around the core. Please be aware that the coating at the edge is thinner (edge coverage). In case of thermal stress (e.g. thermal shock), please be aware that epoxy might crack due to its different thermal expansion. Also mechanical stress (vibrations/shocks) might create cracks also. If small cracks may create problems during the lifetime of your product, we recommend you to select cased cores or take foil bandaged version instead. please check the usability in advance in your application. A general recommendation for epoxy coated cores is to add an additional insulation (like foil bandage) before copper winding.

Marking defines how the product is marked, the date code may be given by international norms, e.g. IEC 60062 section 6.1.1, see also the attachment below in this document. The letter size is adjusted according to the core size to have the best readability.

Packing defines how one package unit is built up and how many parts are in one packaging unit (PU).

Comments section shows any further comments, special information for this product.

5. Comments :	
	

Section comments shows any comment for this product.

Footer sections give information about the history of indexes and revisions of the product, and signatures about the releasing process of the document.

Nominal current

for EMC choke, defines the allowed maximum current for the maximum operating temperature (in this example 70°C). The choke may heat up to its maximum allowed temperature, which is defined by the selected plastic materials, generally 130°C. (For the exact value, please consult the UL yellow sheet's RTI values or please contact MAGNETEC's technical sales for confirmation). Regarding derating and forced cooling of CMC, see attachment B.

for CT component, it is the current for which the CT is designed for.

Leakage inductance for EMC choke, is the inductance of the component measured with one winding in shortcut. It is a not guaranteed ca. value.

Wire Resistance is the wire resistance at RT, for more details about performed tests see section 3 inspection value.

High voltage strength

is showing the high voltage strength level to be applied between primary and secondary side for CTs which is tested as type test. High voltage strength test can be performed as type test or in serial production. For this case, see info section 3 (inspection values)

is showing the high voltage strength level to be applied between the lines for EMC which is tested as type test. High voltage strength test can be performed as type test or in serial production. For this case, see info section 3 (inspection values)

Design standard:

For EMC chokes the standard IEC EN 60938-1 is regulating the necessary clearance and creepage distances. Assumed pollution degree is 2, in case of other pollution degree in the application, customer is asked to do the recalculation.

For CT Components, the standard DIN EN 62053-21 is valid for dc tolerant metering devices with accuracy class 1 and 2.

Inspection values:

EMC Component:

3. Inspection values			
Measured value	Measuring limits	Measuring configurations	
Inductivity L1; L2; L3 [mH]	0,76 - 1,69	f = 10 kHz	Ueff = 0,1 V
Inductivity L1; L2; L3 [mH]	0,6 - NA	f = 100 kHz	Ueff = 0,1 V
Wire resistance Rcu 1; Rcu2; Rcu3 [mOhms]	0 - 1,8	T = 23±3°C	
HV strength between N1; N2; N3 / Iiso<1mA	OK - NOK	Ueff = 2,5 kV	t = 2 s

CT Component:

3. Inspection values			
Measured value	Measuring limits	Measuring configurations	
Inductivity L 2 [H]	2,5 - 3,3	f = 50 Hz	Ueff = 1V
Wire resistance Rcu 2 [Ohms]	0 - 65	RT = 25 °C	
N2 turns	2475 - 2525		
	-		

Inspection values list up the guaranteed values with the corresponding measurement conditions. Where temperature is not given, the test is valid for room temperature, $T=23\pm3^{\circ}\text{C}$.

Others:

4. Others	
	Marking: MAGNETEC MB-667-01 YM (YM = Year/Month), acc. to IEC 60062 6.1.1
	Packaging: 6 pcs. per layer, 3 layers per carton box; PU = 18 pcs.
	Comments:

Attachment A)

IEC 60062 6.1.1 defines the following syntax for the date code:

Year of the production: (1. Code numeral)

Year	Code	Year	code	Year	code
2010	A	2020	M	2030	A
2011	B	2021	N	2031	B
2012	C	2022	P	2032	C
2013	D	2023	R	2033	D
2014	E	2024	S	2034	E
2015	F	2025	T	2035	F
2016	H	2026	U	2036	H
2017	J	2027	V	2037	J
2018	K	2028	W	2038	K
2019	L	2029	X	2039	L

The code starts each 20th year newly.

Month of production (2. Code numeral)

Month	Code	Month	code
January	1	July	7
February	2	August	8
March	3	September	9
April	4	October	O
May	5	November	N
June	6	December	D

Examples:

Date code	Prudction date
B5	2011 May
DD	2013 December

Attachment B for CM)

Explanation of the derating and forced cooling

The nom. current is the current when the choke surface temperature is about ca. 120°C due to the the copper loss heating at the max. ambient temperature (max. ambient temperature as indicated in the component datasheet, typically 60°C). This nom. current is very depending on the max. ambient temperature.

The new nom. current at another ambient temperature T_{am_new} can be estimated by the derating theory, see fig. 1:

Fig. 1: estimated I_{nom_new}/I_{nom} at different ambient temperatures

For example, the nominal current of MB-007 is ca. 16A at a max. ambient temperature=60°C (see datasheet in fig. 2). If in the application, operating temperature is only 40°C, the estimated new nom current can be estimated by $115\% \cdot 16A = ca. 18,5A$ (see fig 1). If the new ambient temperature is instead 80°C instead of 60°C, the new nom. current at 80°C can be estimated by $80\% \cdot 16A = ca. 13A$ (see fig 1).

If not other identified in the datasheet, this is valid for free convection, if forced cooling is applied, the new nom. current is about 140% of the value with only free convection, e.g. MB-007-02-02 should be able to handle about $16A \cdot 140\% = ca. 22,5A$

These values are without engagement and needs to be tested in the application.
